GUARDIAN ANGEL

8-Adelfa Group 6
Dela Cruz, Ibarra, Medroso, Magallanes

RATIONALE

Widespread poverty creates a dangerous cycle of illness fueled by limited education, financial barriers, and fragile healthcare systems. In many regions, the absence of digital connectivity forces vulnerable populations to rely on unverified home remedies rather than professional medical advice. When combined with unsanitary living conditions, these factors transform local communities into high-risk breeding grounds for pathogens, significantly increasing the likelihood of localized outbreaks evolving into devastating epidemics.

OVERVIEW & RELEVANCE

Guardian Angel is a health application designed to make medical guidance available for everyone: from senior citizens to underserved communities. By analyzing symptoms, the app provides immediate clarity on minor illnesses while serving as a critical safety net that identifies more serious conditions requiring professional medical intervention.

Beyond basic triage, the platform acts as a comprehensive wellness hub by calculating BMI and tracking laboratory data. By using these values, Guardian Angel delivers warnings to prevent potential health risks, transforming reactive care into a predictive, life-saving tool available on any mobile or desktop device.

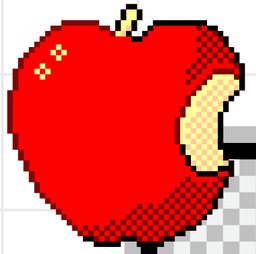
TO PROVIDE THE USER WITH...



Tips on how to cure SOME diseases

Information about hospital laboratory results

Clinical-grade insights

TECHNICAL APPROACH

Developed primarily in Python for its efficiency and logic, Guardian Angel evolved from a bug-ridden prototype into a refined, functional tool through rigorous iterative development. The intensive, weeks-long collaboration not only resolved complex technical overlaps but also united the team in a shared mission to provide a high-quality health resource for the community.
